

Use Spread and Notes for ES5 Set() Integration

Do you remember the ES6 spread operator `...`?

`...` can take iterable objects in ES6 and turn them into arrays.

Let's create a Set, and check out the spread function.

```
var set = new Set([1,2,3]);  
var setToArr = [...set]  
console.log(setToArr) // returns [ 1, 2, 3 ]
```

In this exercise we will pass a set object to the `checkSet` function. It should return an array containing the values of the Set.

Now you've successfully learned how to use the ES6 `Set()` object, good job!

`checkSet(new Set([1,2,3,4,5,6,7]))` should return
`[1,2,3,4,5,6,7]`
